*Note: NGC 7128 has a special distribution. Almost all of the cluster is contained within a 7x7 arcmin space with high density; however, several stars are much further out, almost doubling the cluster's size in each dimension.

All of the clusters listed in this table were chosen by criteria of 1) being within the coordinate range from part 1, 2) having a listed angular size smaller than 27x27 arcmin, 3) being listed as determined to be a real cluster, and 4) having easily recognizable patterns of stars (not being too generic)
